L1 ANSWER 1 OF 4 BIOSIS COPYRIGHT (c) 2006 The Thomson Corporation on STN
TI Process for the biological production of 1,3-propanediol with high titer.
AB The present invention provides an improved method for the biological
production of 1,3-propanediol from a fermentable carbon source in a single
microorganism. In one aspect of the present invention, an improved
process for the conversion of glucose to 1,3-propanediol is achieved by
the use of an E. coli transformed with the Klebsiella pneumoniae dha
regulon genes dhaR, orfY, dhaT, orfX, orfW, dhaB1, dhaB2, dhaB3, and orfZ,
all these genes arranged in the same genetic organization as found in wild
type Klebsiella pneumoniae. In another aspect of the present invention,
an improved process for the production of 1,3-propanediol from glucose
using a recombinant E. coli containing genes encoding a G3PDH, a G3P
phosphatase, a dehydratase, and a dehydratase reactivation factor compared
to an identical process using a recombinant E. coli containing genes
encoding a G3PDH, a G3P phosphatase, a dehydratase, a dehydratase
reactivation factor and a 1,3-propanediol oxidoreductase (dhaT). The
dramatically improved process relies on the presence in E. coli of a gene
encoding a non-specific catalytic activity sufficient to convert
3-hydroxypropionaldehyde to 1,3-propanediol.

TI 1,3-Propanediol and polymer derivatives from a fermentable carbon source

AB A new polypropylene terephthalate composition is provided. The polypropylene terephthalate is comprised of 1,3-propanediol and terephthalate. The 1,3-propanediol is produced by the bioconversion of a fermentable carbon source, preferably glucose. The resulting polypropylene terephthalate is distinguished from petrochem. produced polymer on the basis of dual carbon-isotopic fingerprinting, which indicates both the source and the age of the carbon. Thus, Escherichia coli transformed with the dha regulon of Klebsiella pneumoniae, was able to produce 8.1-10.9 g/L 1,3-propanediol. This biol. produced monomer was then used to produce polypropylene terephthalate.

TI Bioconversion of a fermentable carbon source to 1,3-propanediol by a single microorganism expressing a foreign glycerol or diol dehydratase gene
AB A process is provided for the bioconversion of a carbon substrate, preferably glucose, to 1,3-propanediol by a single organism utilizing microorganisms containing the genes encoding for an active glycerol or diol dehydratase enzyme. Specifically, the glycerol dehydratase gene of Klebsiella pneumoniae is used to prepare a transgenic microorganism capable of forming 1,3-propanediol from glucose in high yield. A cosmid covering the dha regulon of K. pneumoniae was cloned and the gene for the dehydratase (dhaB1, dhaB2, dhaB3) and the propanediol dehydrogenase were cloned and expressed in a variety of prokaryotic and eukaryotic microbial hosts with the manufacture of the propanediol from glucose or maltose demonstrated.

L2 ANSWER 5 OF 8 USPATFULL on STN

TI 1,3-propanediol and polymer derivatives from a fermentable carbon source
AB A new polypropylene terephthalate composition is provided. The polypropylene terephthalate is comprised of 1,3-propanediol and terephthalate. The 1,3-propanediol is produced by the bioconversion of a fermentable carbon source, preferable glucose. The resulting polypropylene terephthalate is distinguished from petrochemically produced polymer on the basis of dual carbon-isotopic fingerprinting which indicates both the source and the age of the carbon.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 1 OF 12 USPATFULL on STN

TI Process for the biological production of 1,3-propanediol with high titer

AB The present invention provides an improved method for the biological production of 1,3-propanediol from a fermentable carbon source in a single microorganism. In one aspect of the present invention, an improved process for the conversion of glucose to 1,3-propanediol is achieved by the use of an E. coli transformed with the **Klebsiella pneumoniae** dha regulon genes dhaR, orfY, **dhaT**, orfX, orfW, **dhaB1**, **dhaB2**, **dhaB3**, and

orfZ, all these genes arranged in the same genetic organization as found in wild type *Klebsiella pneumoniae*. In another aspect of the present invention, an improved process for the production of 1,3-propanediol from glucose using a recombinant *E. coli* containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, and a dehydratase reactivation factor compared to an identical process using a recombinant *E. coli* containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, a dehydratase reactivation factor and a 1,3-propanediol oxidoreductase (**dhaT**). The dramatically improved process relies on the presence in *E. coli* of a gene encoding a non-specific catalytic activity sufficient to convert 3-hydroxypropionaldehyde to 1,3-propanediol.

TI Process for the biological production of 1,3-propanediol with high yield

AB The present invention provides a microorganism useful for biologically

producing 1,3-propanediol from a fermentable carbon source at higher yield than was previously known. The complexity of the cofactor requirements necessitates the use of a whole cell catalyst for an industrial process that utilizes this reaction sequence to produce 1,3-propanediol. The invention provides a microorganism with disruptions in specified genes and alterations in the expression levels of specified genes that is useful in a higher yielding process to produce 1,3-propanediol.

TI Method for the production of 1,3-propanediol by recombinant organisms
comprising genes for vitamin B12 transport

AB Recombinant organisms are provided comprising genes encoding genes
encoding glycerol dehydratase, 1,3-propanediol oxidoreductase, a gene
encoding vitamin B.sub.12 receptor precursor(BtuB), a gene encoding
vitamin B.sub.12 transport system permease protein(BtuC) and a gene
encoding vitamin B.sub.12 transport ATP-binding protein (BtuD). The
recombinant microorganism is contacted with a carbon substrate and
1,3-propanediol is isolated from the growth media.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Method for identifying the source of carbon in 1,3-propanediol
AB A new polypropylene terephthalate composition is provided. The polypropylene terephthalate is comprised of 1,3-propanediol and terephthalate. The 1,3-propanediol is produced by the bioconversion of a fermentatble carbon source, preferable glucose. The resulting polypropylene terephthalate is distinguished from petrochemically produced polymer on the basis of dual carbon-isotopic fingerprinting which indicates both the source and the age of the carbon.

TI Method for the recombinant production of 1,3-propanediol
AB The present invention provides an improved method for the production of 1,3-propanediol from a variety of carbon sources in an organism capable of 1,3-propanediol production and comprising DNA encoding protein X of a microorganismal dehydratase or protein X in combination with at least one of protein 1, protein 2 and protein 3, which proteins are comparable to those encoded by orfY, orfX and orfW, respectively from a microorganismal dha regulon. The protein X may be isolated from a diol dehydratase or a glycerol dehydratase. The present invention also provides host cells comprising protein X that are capable of increased production of 1,3-propanediol.

L8 ANSWER 1 OF 20 USPATFULL on STN
TI Process for the biological production of 1,3-propanediol with high titer
AB The present invention provides an improved method for the biological production of 1,3-propanediol from a fermentable carbon source in a single microorganism. In one aspect of the present invention, an improved process for the conversion of glucose to 1,3-propanediol is achieved by the use of an E. coli transformed with the **Klebsiella pneumoniae** dha regulon genes dhaR, orfY, dhaT, orfX, orfW, dhaB1, dhaB2, dhaB3, and orfZ, all these genes arranged in the same genetic organization as found in wild type **Klebsiella pneumoniae**. In another aspect of the present invention, an improved process for the production of 1,3-propanediol from glucose using a recombinant E. coli containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, and a dehydratase reactivation factor compared to an identical process using a recombinant E. coli containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, a dehydratase reactivation factor and a 1,3-propanediol oxidoreductase (dhaT). The dramatically improved process relies on the presence in E. coli of a gene encoding a non-specific catalytic activity sufficient to convert 3-hydroxypropionaldehyde to 1,3-propanediol.

L8 ANSWER 10 OF 20 USPATFULL on STN

TI Process for the biological production of 1,3-propanediol with high titer
AB The present invention provides an improved method for the biological production of 1,3-propanediol from a fermentable carbon source in a single microorganism. In one aspect of the present invention, an improved process for the conversion of glucose to 1,3-propanediol is achieved by the use of an E. coli transformed with the **Klebsiella pneumoniae** dha regulon genes dhaR, orfY, dhaT, orfX, orfW, dhaB1, dhaB2, dhaB3, and orfZ, all these genes arranged in the same genetic organization as found in wild type **Klebsiella pneumoniae**. In another aspect of the present invention, an improved process for the production of 1,3-propanediol from glucose using a recombinant E. coli containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, and a dehydratase reactivation factor compared to an identical process using a recombinant E. coli containing genes encoding a G3PDH, a G3P phosphatase, a dehydratase, a dehydratase reactivation factor and a 1,3-propanediol oxidoreductase (dhaT). The dramatically improved process relies on the presence in E. coli of a gene encoding a non-specific catalytic activity sufficient to convert 3-hydroxypropionaldehyde to 1,3-propanediol.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

 *TI METHOD FOR THE RECOMBINANT PRODUCTION OF 1,3-PROPANEDIOL
 AB The present invention provides an improved method for the production of
 1,3-propanediol from a variety of carbon sources is an organism
 comprising DNA encoding protein X of a dehydratase or protein X in
 combination with at least one of protein 1, protein 2 and protein 3. The
 protein X may be isolated from a diol dehydratase or a glycerol
 dehydratase. The present invention also provides host cells comprising
 protein X that are capable of increased production of 1,3-propanediol.

TI Method for the production of 1,3-propanediol by recombinant organisms comprising genes for vitamin B12 transport
AB Recombinant organisms are provided comprising genes encoding genes encoding glycerol dehydratase, 1,3-propanediol oxidoreductase, a gene encoding vitamin B.sub.12 receptor precursor(BtuB), a gene encoding vitamin B.sub.12 transport system permease protein(BtuC) and a gene encoding vitamin B.sub.12 transport ATP-binding protein (BtuD). The recombinant microorganism is contacted with a carbon substrate and 1,3-propanediol is isolated from the growth media.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L8 ANSWER 13 OF 20 USPATFULL on STN
TI Method for identifying the source of carbon in 1,3-propanediol
AB A new polypropylene terephthalate composition is provided. The polypropylene terephthalate is comprised of 1,3-propanediol and terephthalate. The 1,3-propanediol is produced by the bioconversion of a fermentatble carbon source, preferable glucose. The resulting polypropylene terephthalate is distinguished from petrochemically produced polymer on the basis of dual carbon-isotopic fingerprinting which indicates both the source and the age of the carbon.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
